

Methodology Supplement - Regression Coefficients

Background

This document serves as a supplement to the paper titled "Medicare Risk Arrangement and Use and Outcomes Among Physician Groups", which was published in *JAMA Network Open* in January 2025. It provides regression coefficients of the models run for 20 different outcomes that are referenced in the manuscript.

For additional information, please refer to the methods section and the online supplemental material of the following publication: Cohen et al. "Medicare Risk Arrangement and Use and Outcomes Among Physician Groups." *JAMA Network Open* 8, no. 1 (2025): e2456074-e2456074.

Models Overview and variables

Multivariable logistic regression was employed to model 20 outcome measures as binary indicators. The primary comparison was made between at-risk Medicare Advantage (MA) and Fee-For-Service (FFS) MA cohorts within the same physician groups over the period of 2016 to 2019 (variable name: group_ma_risk).

Regression adjustments included the following set of covariates:

Table 1 List of Covariates and Labels

Variable	Variable name
